

WP2 LEGACY STATUS

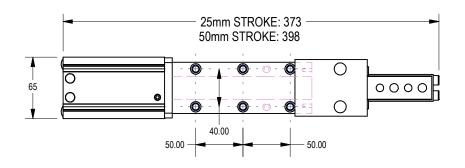

EFFECTIVE 1/1/21: WP2 IS LEGACY STATUS, ONLY AVAILABLE AS SERVICE PARTS AVAILABILITY, PRICING & DELIVERY LEAD TIMES ARE NOT GUARANTEED.

UB2 RECOMMENDED REPLACEMENT FOR WP2

LEGACY SHOT PINS

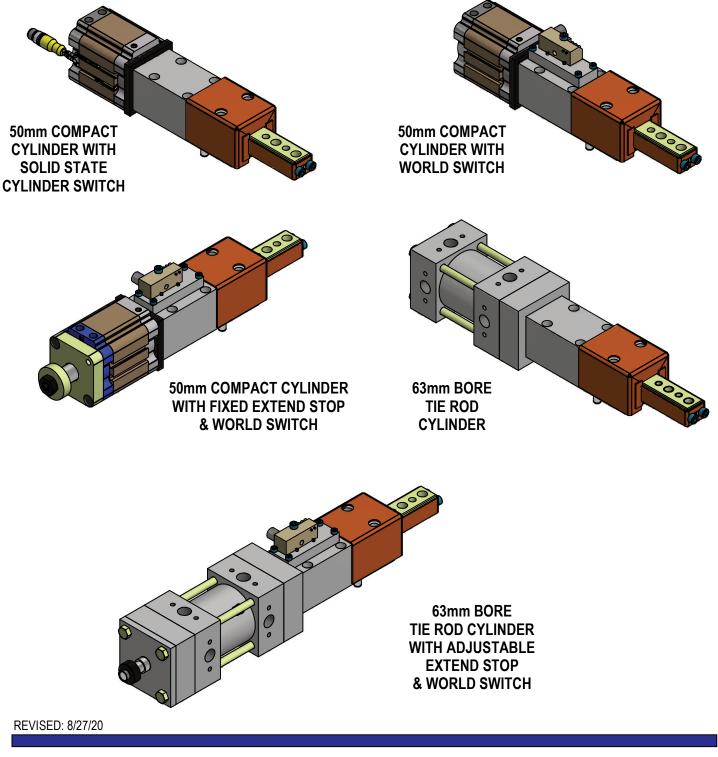

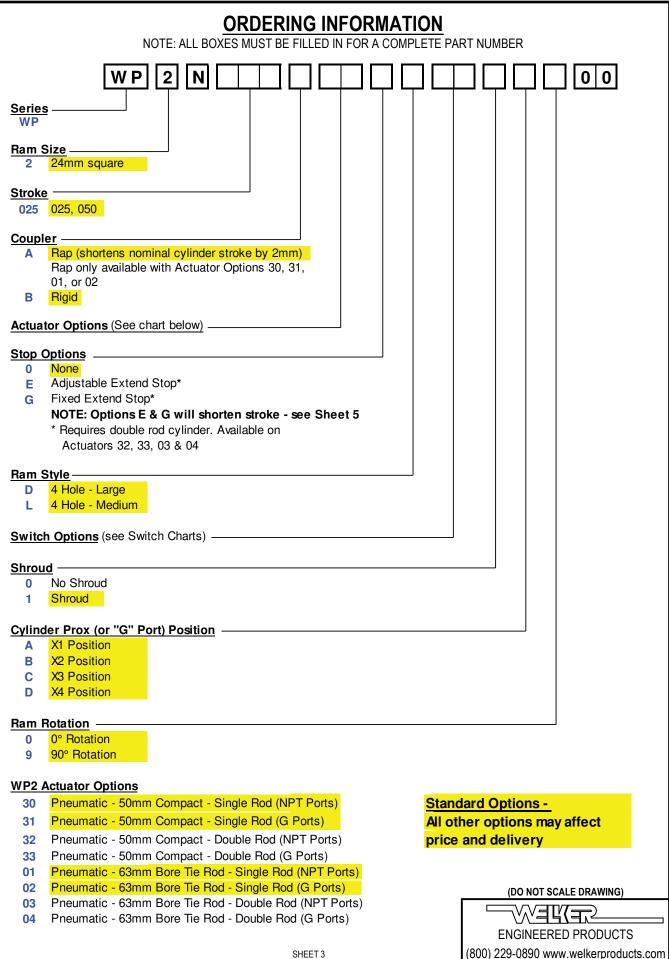

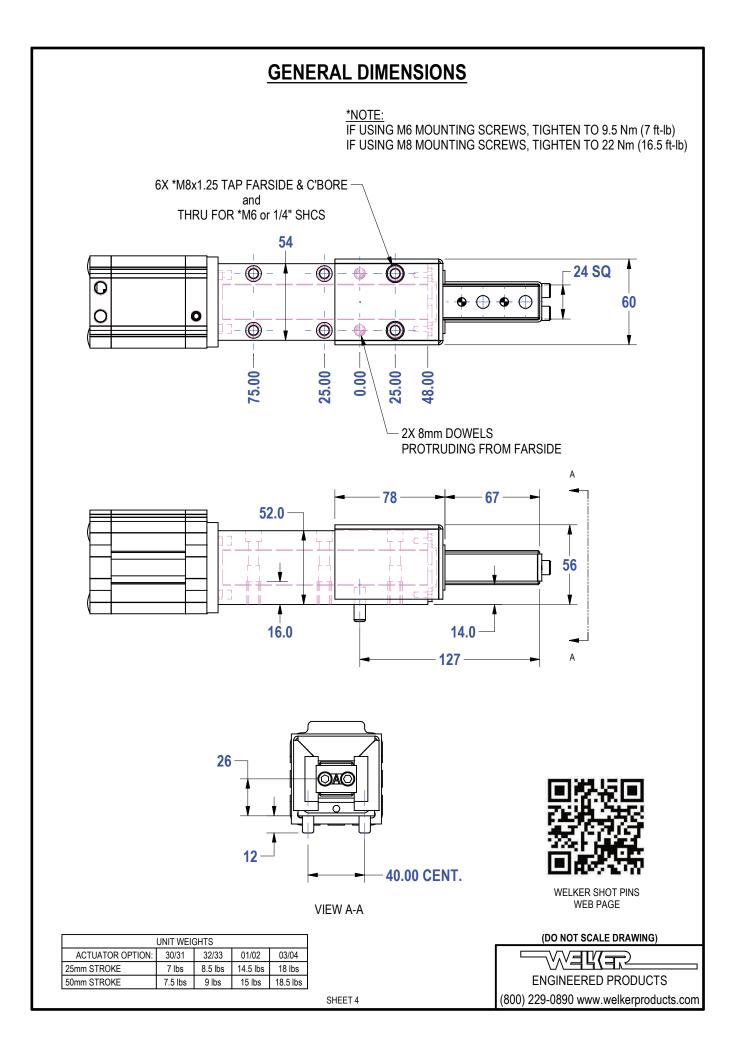

Welker Engineered Products 1401 Piedmont Troy, MI 48083 (248) 528-2020 www.welkerproducts.com

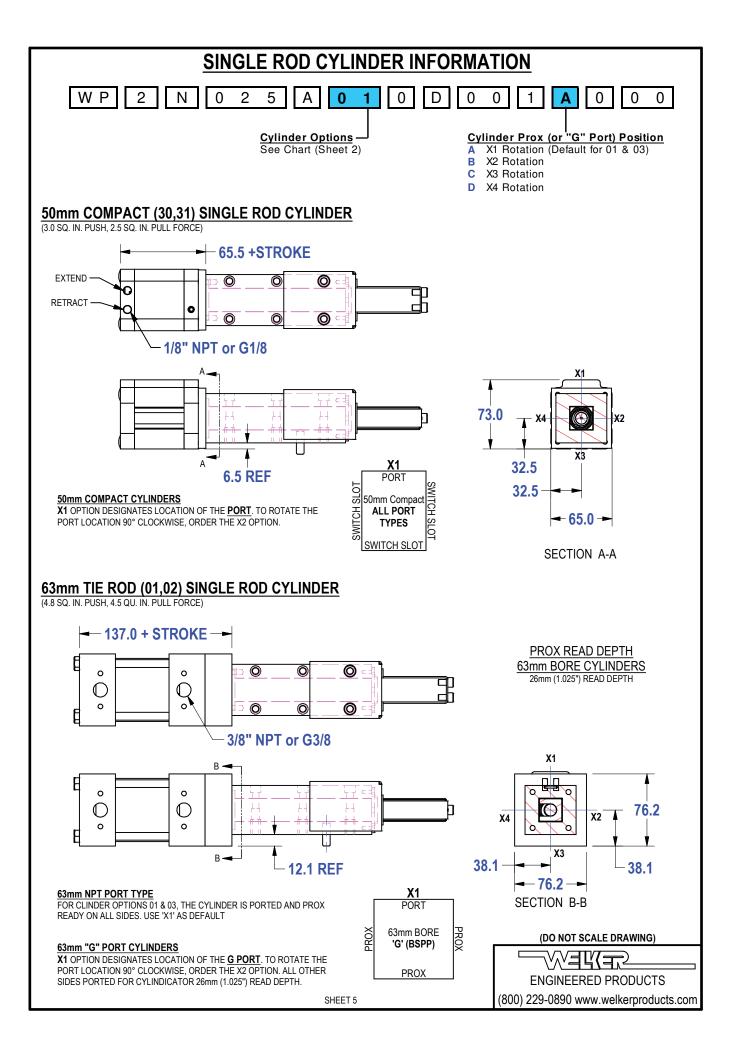

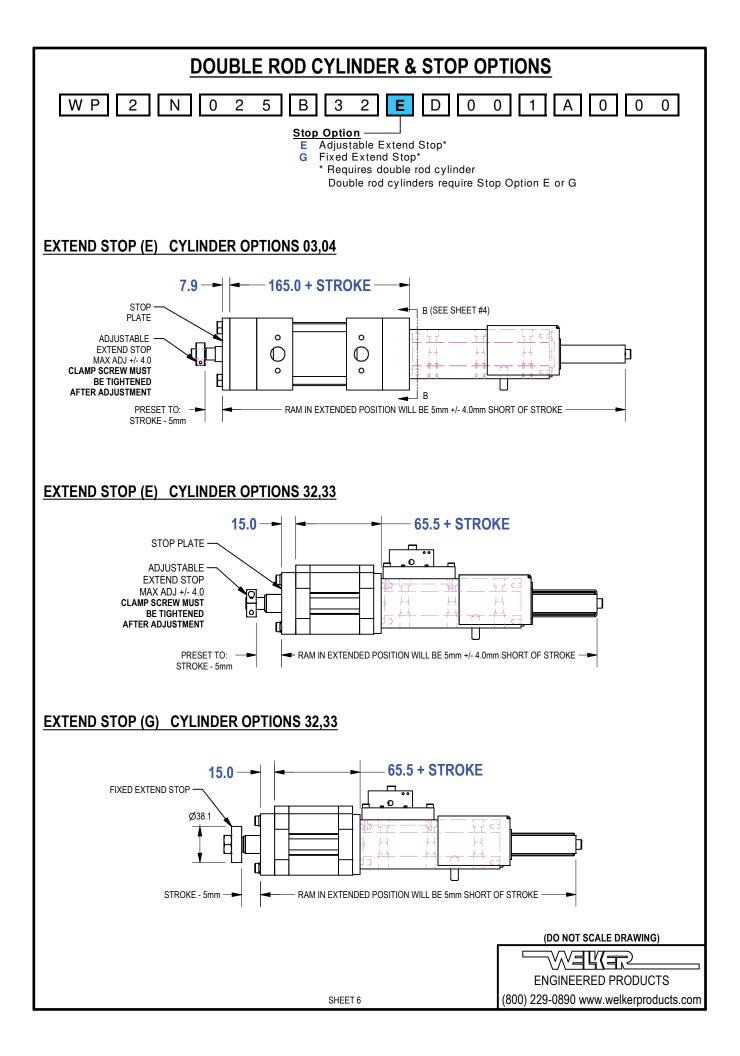

WP2 SERIES GOLD LINE SHOT PINS

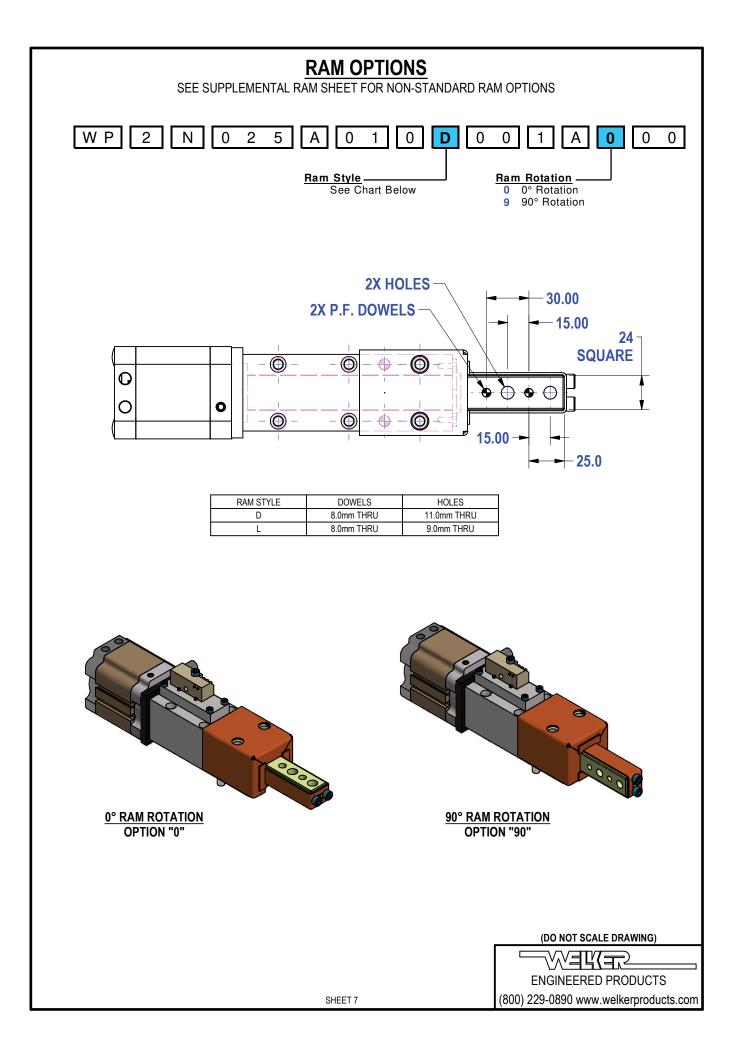

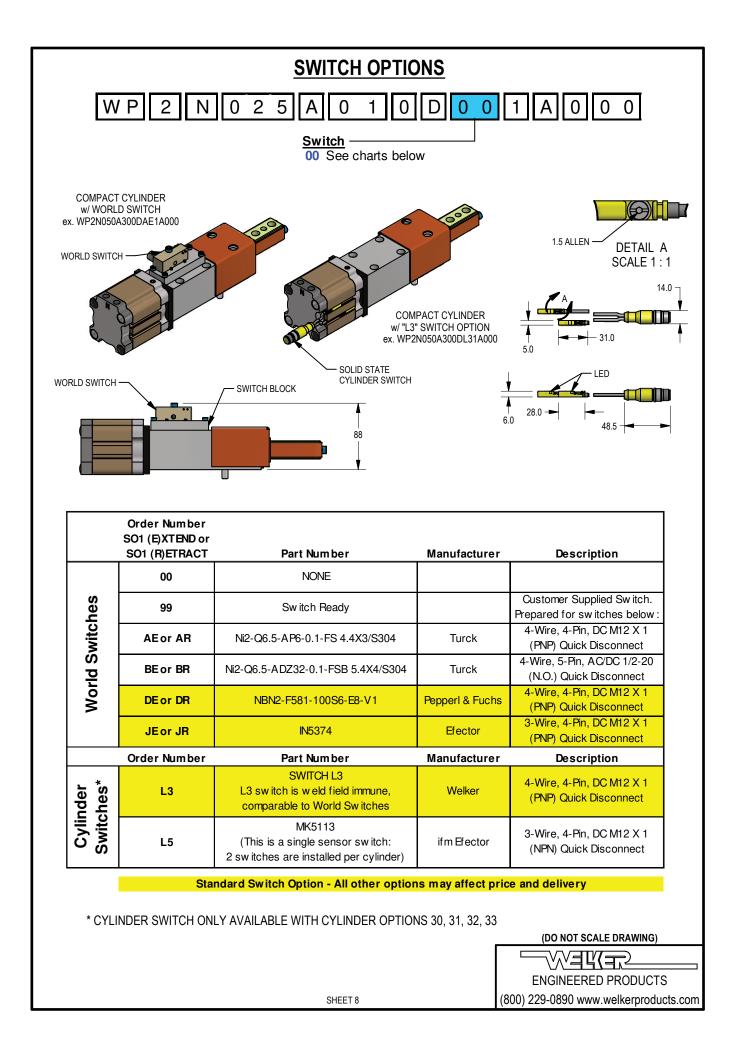

Welker WP2 Shot Pin Technical Information

Body Mounting: Square ram shot pin units have dual mounting capability. At all mounting locations, you have the option of mounting from the top using the counter-bored clearance holes or the same holes, tapped from the bottom. Using any four of the six holes, symmetrical about the centerline, is sufficient. Protruding mounting dowels are provided and are press fit into the body. IF USING M6 MOUNTING SCREWS, TIGHTEN TO 9.5 Nm (7 ft-lb) IF USING M8 MOUNTING SCREWS, TIGHTEN TO 22 Nm (16.5 ft-lb)

Square ram packages are high precision full contact plane bearing units and therefore must be mounted to a flat surface. **Mounting** surfaces must be flat within .002" (0.05mm).

Ram Mounting: Square ram shot pin units use a standard NAAMS L-Block pattern with 15mm spacing. Spacing allows mounting of 3 and 4 hole pin retainers and L-blocks to the ram. Through holes can be tapped and fitted with standard thread inserts.

Shrouds: Safety orange steel shrouds are available for additional protection. Shrouds prevent undesirable buildup of contamination from welding and machining applications. Welker specifically recommends shroud usage in MIG, TIG and arc welding applications. Shrouds should only be removed if clearance problems exist and conditions permit. Consult Welker.

Wipers: The wiper is the only maintenance item on Welker pin units. It is a custom molded moly impregnated urethane wiper. Welker recommends changing the wiper yearly. Specific applications may require more or less frequent wiper service.

Stroke: The stroke accuracy of shot pins is limited to that of the cylinder. Normal cylinder stroke accuracy is \pm .015" (0.38mm). For control of "end of stroke" repeatability, see extend and retract stop options for each series.

Rap couplings cause the unit to be less than the nominal stroke of the cylinder. The 24mm ram and 40mm ram units have a 2mm rap. The rap allows the cylinder to begin moving before moving the ram. The impact of the coupler helps free tooling from a bound condition. Most applications using a pneumatic shot pin should have rap couplings while most hydraulic shot pin applications should use a rigid coupler.

Welker cylinders do not require lubrication.

Switch: 24mm ram tie rod cylinders use prox switch (cylindicator) ports with 1.025" read depth (probe length). Shot pins ordered with compact cylinders are cylinder switch ready. Solid state cylinder switches and World Switches are available though Welker.

Repeatability: Shot pin units utilize a full contact bearing surface for high repeatability. Repeatability within ±.002" (0.05mm) part to part is achievable.

Wear: Wear equals variance in position under load over time. Shot pin tests indicate maximum wear of .002" wear at 3 million cycles.

Loading and Deflection: Maximum deflection is \pm .005" and is measured at the **end of the ram** up to the specified strokes and up to the loads and distances as shown below. Longer extensions can be used at lower tolerances and loads. Pins mounted closer to the body exhibit less deflection. For applications with longer strokes and higher loads, consult Welker.
